

1) Create a basic square

2) Goto object menu > path > Add anchor points

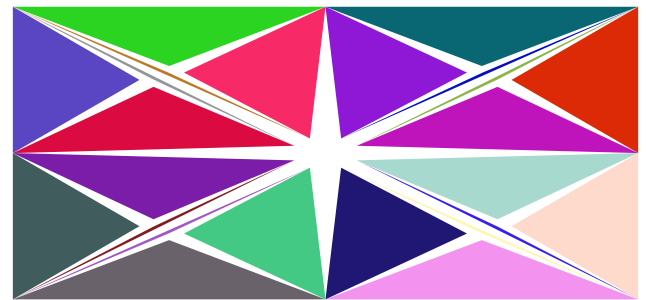

3) Set the approach value first screen to 90 as this creates a slice 90% from original point position and center of the original path

4) The plugin is spread over multiple dialogs and the checkboxes (or on or off settings) are in the 'settings' dialog. Set the slices to different colors based on the current document model (in this case RGB).

The swatches item can be even more useful if you wish to fill the slices with patterns or gradients or perhaps remove all the items from the swatches and fill with blue or red swatches to create a slice set from random blues or red

5) Re-apply the plugin to the new set of paths. Because the plugin uses all the points, you may get additional thing slices from points close to other points, these can be quickly removed manually

6) Random color flag
